# 1 Function (函數)

## I Definition and notation

A function is formed by three sets, the domain (定義域)  $X$ , the codomain (對應域)  $Y$ , and the graph  $R$  that satisfy the three following conditions:

$$R \subseteq \{(x, y) \mid x \in X, y \in Y\}$$

$$\forall x \in X, \exists y \in Y, (x, y) \in R$$

$$(x, y) \in R \wedge (x, z) \in R \implies y = z$$

A function  $f$  that satisfies the above is denoted as:

$$f: X \rightarrow Y.$$

in which the domain  $X$  is also denoted as  $D_f$ .

The range (值域), denoted as  $R_f$  or  $f(X)$ , is defined as:

$$\{y \mid \exists x \in X, (x, y) \in R\}.$$

If  $x \in X$  and  $(x, y) \in R$ , we write  $y = f(x)$ , in which  $f(x)$  is called the image of  $x$  under  $f$ ,  $x$  is called the independent variable (自變數/獨立變數), and  $y$  is called the dependent variable (應變數/依賴變數); and the function  $f$  is also denoted as:

$$f: X \rightarrow Y; x \mapsto y.$$

## II Properties

Consider function  $f$ :

$$f: X \rightarrow Y; x \mapsto y.$$

### i Injection (單射)/Injective function/One-to-one (一對一) function

$$\forall a, b \in X \text{ s.t. } f(a) = f(b) : a = b$$

## III Many-to-one (多對一) function

$$\exists a \neq b \in X : f(a) = f(b)$$

### i Surjection (滿射/蓋射)/Surjective function/Onto function

$$f(X) = Y$$

### ii Bijection (對射)/Bijective function/One-to-one (一對一) function/One-to-one correspondence (一一對應)

Injective and surjective function.

### iii (Monotone) Increasing ( (單調) 遞增)/Non-Decreasing (非遞減) function

$f$  is increasing on  $I \subseteq X$  if and only if

$$\forall a, b \in I : a < b \implies f(a) \leq f(b).$$

$f$  is increasing if and only if

$$\forall a, b \in X : a < b \implies f(a) \leq f(b).$$

### iv Strictly increasing (嚴格遞增) function

$f$  is strictly increasing on  $I \subseteq X$  if and only if

$$\forall a, b \in I : a < b \implies f(a) < f(b).$$

$f$  is strictly increasing if and only if

$$\forall a, b \in X : a < b \implies f(a) < f(b).$$

### v (Monotone) Decreasing ( (單調) 遞減)/Non-Increasing (非遞增) function

$f$  is decreasing on  $I \subseteq X$  if and only if

$$\forall a, b \in I : a < b \implies f(a) \geq f(b).$$

$f$  is decreasing if and only if

$$\forall a, b \in X : a < b \implies f(a) \geq f(b).$$

### vi Strictly decreasing (嚴格遞減) function

$f$  is strictly decreasing on  $I \subseteq X$  if and only if

$$\forall a, b \in I : a < b \implies f(a) > f(b).$$

$f$  is strictly decreasing if and only if

$$\forall a, b \in X : a < b \implies f(a) > f(b).$$

### vii Monotone (單調) function

$f$  is monotone on  $I \subseteq X$  if and only if it is either monotone increasing or monotone decreasing on  $I$ .

$f$  is monotone if and only if it is either monotone increasing or monotone decreasing.

## IV Transformation

### i Translation (平移)

For any function  $f : \mathbb{R} \rightarrow \mathbb{R}$ , shifting  $y = f(x)$  right by  $h$  units and up by  $k$  units on the  $xy$  coordinate plane yields  $y = f(x - h) + k$ .

## ii Scaling (伸縮/縮放/拉伸)

For any function  $f : \mathbb{R} \rightarrow \mathbb{R}$ , on the  $xy$  coordinate plane, expand  $y = f(x)$  vertically by  $a$  times the original value with the  $x$  axis as the reference line, and expand  $y = af\left(\frac{x}{b}\right)$  horizontally by  $b$  times the original value with the  $y$  axis as the reference line, to obtain  $y = af\left(\frac{x}{b}\right)$ .

## V Common ways to define functions

### i Function composition (函數合成)

For two functions  $f : X \rightarrow Y$  and  $g : V \rightarrow W$  such that  $g(V) \subseteq X$ , the composition of them, denoted as  $(f \circ g)$ , is defined as:

$$(f \circ g) : V \rightarrow Y; x \mapsto f(g(x))$$

### ii Inverse function (反函數)

For a bijective function  $f : X \rightarrow Y$ , the inverse of it, denoted as  $f^{-1}$ , is defined as:

$$f^{-1} : Y \rightarrow X; f(x) \mapsto x$$

### iii Power notation

For a bijective function  $f : X \rightarrow X$ ,  $f^0$  is defined by:

$$f^0 : X \rightarrow X; x \mapsto x,$$

$f^n(x)$  for any  $n \in \mathbb{N}$  is defined by:

$$f^n : X \rightarrow X; x \mapsto f(f^{n-1}(x)),$$

and  $f^{-n}(x)$  for any  $n \in \mathbb{N}$  is defined by:

$$f^{-n} : X \rightarrow X; x \mapsto f^{-1}(f^{-n+1}(x)).$$

### iv Piecewise function (分段函數)

A piecewise function is a function defined in the form:

$$f(x) = \begin{cases} f_1(x), & x \in A_1, \\ f_2(x), & x \in A_2, \\ \vdots \\ f_n(x), & x \in A_n \end{cases},$$

where

$$\bigcup_{i=1}^n A_i = D_f \wedge \forall i \neq j \wedge i, j \in \mathbb{N} \wedge i, j \leq n : A_i \cap A_j = \emptyset.$$
